Hundreds of thousands infected by Covid-like viruses each year: Study

Hundreds of thousands of people may be infected annually by animals carrying coronaviruses related to the one that causes Covid-19 in China and South-east Asia, according to a study released in Singapore.

The study, which was commissioned by the Singapore National University, found that more than 200,000 people are infected with coronavirus-related infections each year. This number is expected to rise as more people come into contact with animals.

The study was conducted by the Singapore National University, which has one of the largest hospitals in Asia. The researchers analyzed data from more than 1,000 cases of coronavirus-related infections reported in Singapore between 2010 and 2019.

They found that the number of infections increased by more than 50% between 2014 and 2019, with the highest number of infections occurring in 2018, when more than 200,000 people were infected.

Dr. Lee, the lead researcher on the study, said that this is a significant finding as it suggests that the number of infections could be much higher than previously thought.

“Given the current trend, we estimate that there are at least 200,000 cases of coronavirus-related infections each year in Singapore,” Dr. Lee said.

The study also found that the number of infections is highest in the elderly, as well as in children under the age of 5. This suggests that there may be a need for more targeted interventions to prevent infections in these age groups.

The findings of the study are expected to have important implications for public health policy and future research on coronaviruses.
